

MEMORIES

Website Build Specification

memoriesjournal.com

Implementation-grade product, design, copy, asset, privacy, accessibility, and deployment brief for
Cursor.

Prepared from the Memories app brief, current status, Phase 2 handoff, supplied brand mark, and the current
getisles.com website source.

DOMAIN	APP	PHASE
memoriesjournal.com	iPhone / iOS 18+	3A - Website + launch surface

- PART XX - CURSOR BUILD PHASES
- PART XXI - ACCEPTANCE CHECKLIST
- PART XXII - FINAL CURSOR MASTER INSTRUCTION
- PART XXIII - REQUIRED CURSOR FINAL REPORT
- PART XXIV - ASSETS STILL NEEDED FROM THE USER

Build principle: the website should inherit the product taste of [getisles.com](#), while looking unmistakably like Memories. Borrow the structure. Keep the Memories voice, palette, and archive-first product story.

1. How Cursor should use this document

This is a source-of-truth build brief for the Memories marketing website. It should be read together with `APP_BRIEF.md`, `STATUS.md`, `APPLE_SETUP.md`, and the current app code before Cursor changes or creates website files.

The attached/referenced ISLES website is a **structural and tonal reference**, not a template to copy line-for-line. The Memories site should inherit the things that work well about `getisles.com` - simple static architecture, strong hero, product screenshots, a feature story, a large premium section, restrained navigation, and legal/support pages - while developing its own visual identity around the Memories app.

Do not rebuild or modify the iOS app as part of the website pass unless a website asset requires a clearly isolated export helper. The website should live beside the Xcode project, not inside the iOS target.

Do not add new app features merely because the website would be easier to market with them. Marketing must follow the real app.

2. Current Memories product state

The latest Cursor Phase 2 pass reports the following as complete or substantially complete:

- iPhone-only target.
- iOS 18.0 minimum deployment target.
- Simulator uses local SwiftData.
- Physical-device path is prepared for private CloudKit using `iCloud.com.zenzielke.Memories`, with local fallback.
- Today compose/completed/edit flow.
- Mood, tags, custom tags, photos, camera, voice, place, randomized `One more thing` prompts.
- Calendar, Timeline, Search and filters.
- Basic Patterns, weekly/monthly recaps, On This Day.
- Free Year Mosaic.
- Memories+ Year Recap.
- Memories+ Media and Map.
- Memories+ multiple photos.
- Memories+ Collections.
- Memories+ Threads.
- Memories+ Chapters.
- Memories+ Then / Now.
- Memories+ Memory Book PDF export.
- StoreKit 2 structure and local StoreKit testing.
- App Intents are scaffolded/partially wired.

The following should **not** be marketed as current launch features until they are actually completed and physically tested:

- Home Screen or Lock Screen widgets.
- Share Extension.
- Voice transcription UI.
- Video memories.
- Journaling Suggestions.
- Apple Watch.
- Any Apple Journal, Day One, or competing-journal import.

Apple Watch and competitor imports are rejected product directions, not future roadmap items.

The website should be built so feature copy can be updated easily as the launch state changes.

PART I - WEBSITE STRATEGY

3. Website job

The site has four jobs:

1. **Explain Memories in under ten seconds.** A visitor should understand that it is a tiny daily journal that becomes a useful archive over time.
2. **Show the payoff.** The site should spend less time selling the act of journaling and more time showing calendar, year, photos, places, patterns, and remembered days.
3. **Establish trust.** No account, no ads, no cloud AI reading journal entries, local-first behavior, and private Apple-native sync once validated.
4. **Support App Store distribution.** Provide permanent public routes for product information, support, Privacy Policy, and Terms of Use.

The website should not try to become a blog, documentation portal, mental-health resource, social proof engine, or content marketing operation for v1.

4. Core positioning

Use this internally as the website positioning sentence:

A 60-second daily record of your life that gets more interesting the longer you use it.

The site should communicate three ideas in sequence:

- **Today is easy.** Write one small thing.
- **Time does the work.** The archive becomes richer as days accumulate.
- **Looking back is the reward.** Calendar, year, memories, photos, places, Patterns, and Memories+ exploration give the tiny entries value later.

The site should never lead with therapy, self-improvement, wellness, habit formation, emotional intelligence, productivity, or AI.

5. Tone

Website copy should sound like the app:

- short;
- concrete;
- warm without being sentimental;
- observant;
- occasionally dry or lightly playful;
- never inspirational-poster language;
- never therapy language;
- never startup-bro productivity language.

Preferred wording:

- Keep one thing from today.
- A minute is enough.

- 18 days remembered.
- The days you kept.
- Little things you might've missed.
- Your journal isn't a chatbot.
- See more in your memories.

Avoid:

- Begin your journey.
 - Transform your life.
 - Unlock a better you.
 - Build an unstoppable habit.
 - Improve your mental wellness.
 - AI-powered reflection.
 - Never miss a day.
-

PART II - WHAT TO BORROW FROM GETISLES.COM

6. What works in the current ISLES website

Know what your products are actually doing

Isles analyzes products labels and explains the formula to help you decide if it's right for you.

Built for clearer choices

Bias-free analysis

We do not let brands pay to shape product reads, Formula Fit labels, ingredient explanations, or watchouts.

Always 100% ad-free

Absolutely no sponsored placements, paid boosts, or product ads dressed up as recommendations.

Plain-English ingredients

We explains what the formula is trying to do, who it may fit, and which details are worth checking.

Search, scan, or paste your **product labels**

Formula Fit

Get a quick read on what the product is trying to do, who it may work for, and what's worth checking before you buy.

Plain-English

No chemistry-degree nonsense. Isles explains ingredients in normal language, with the role they play in the formula.

Ingredient Roles

See what's doing the work: cleansers, hydrators, barrier helpers, preservatives, fragrance, watchouts, and more.

Analysis

Isles looks at the full formula, not just isolated ingredients, to give you a clearer product read.

History & Saved Products

Revisit your past searches, scans, and pasted labels without starting over. Save the products you care about.

Premium Version

Support our mission

Isles is built to make product labels easier to understand without ads, paid rankings, or brand influence. Premium helps keep the app independent while unlocking more ways to read, compare, and save products.

Unlimited Searches

Look up products before you buy.

Unlimited Scans

Read labels from your camera anytime.

Unlimited Products

Keep your product library without a cap.

Figure 1. Supplied ISLES website reference. Borrow the hierarchy and restraint, not the branding.

The supplied ISLES website uses a straightforward static landing-page structure:

- sticky translucent header;
- prominent logo on the left;
- limited top navigation plus App Store badge;
- large two-column hero;
- app/device artwork as the hero visual;
- a three-column trust/value section;
- an interactive feature showcase with app screenshot plus selectable cards;
- a large colored premium area with rounded cards;
- a minimal four-column footer;
- separate Privacy, Terms, and Contact pages using the same header/footer system;
- light vanilla JavaScript for feature cycling;
- simple static deployment suitable for Vercel.

Those are good bones and should be retained.

Keep the general feel

- Large typography.
- Strong vertical spacing.
- One clear idea per section.
- Product visuals over abstract stock photography.
- Rounded cards used selectively.
- A premium section that visibly changes the page rhythm.
- Very little navigation clutter.
- App Store CTA in the header and hero.
- Legal/support pages that visually remain part of the same brand.

Do not copy literally

Do not reproduce:

- the ISLES green/white skincare palette;
- blobs as the main decorative language;
- the exact hero composition;
- the exact feature-card behavior if a better Memories interaction exists;
- the [Support our mission](#) premium framing;
- Inter/green/product-analysis language;
- the ISLES page copy;
- the ISLES app screenshots or illustration style.

Memories should feel related at the level of product taste, not like the same site with colors swapped.

7. Memories visual metaphor

The design motif should come from the new Memories mark: **stacked day cards**.

The supplied 1024x1024 logo contains three offset rounded rectangles:

- a rear slate card;
- a middle dark-navy card;
- a larger mint front card;
- all on a warm cream field.

This is excellent visual language for the product because it reads as days accumulating without using a literal notebook, pen, heart, brain, smiley face, or calendar icon.

Use the stacked-card geometry throughout the website in small ways:

- hero background layers;
- section separators;
- screenshot framing;
- hover states;
- premium feature cards;
- tiny divider motifs;
- open-graph artwork;
- loading/skeleton states if needed.

Do not turn it into a mascot or repeat the logo mark twenty times.

PART III - BRAND SYSTEM

8. Supplied logo assets

Figure 2. Supplied Memories stacked-day mark (1024 x 1024).

Place/retain these assets under:

```
Memories/  
  Branding/  
    Website/  
      logo.png  
      favicon.png
```

Current supplied files:

- `logo.png` - 1024x1024 PNG.
- `favicon.png` - 64x64 PNG.

The logo artwork currently has an opaque cream background rather than transparency. That matters.

Logo background color extracted from the supplied artwork

`#F1E5CE`

If the logo is placed directly against a different cream, a square edge may become visible. Therefore:

- Use `#F1E5CE` for the header/hero area where the full logo tile is shown; or
- later create a transparent-background export of the stacked-card mark.

Do not fake transparency by CSS masking the bitmap.

The favicon can remain opaque because it is itself a square icon surface.

9. Website color system

Figure 3. Recommended Memories website palette and mood-data colors.

Brand colors from the supplied logo

Role	Hex	Use
Logo Cream	#F1E5CE	Header, hero, logo-safe surfaces
Brand Mint	#8BD0B1	Primary accent, premium surface, key links
Slate	#3E465A	Secondary dark accent
Navy	#2C374F	Main brand dark, headings, buttons

App-derived neutral colors

Role	Hex
App Canvas	#F6F3EC
Raised Surface	#EFEBE3
Primary Ink	#1D1E1B
Secondary Text	#77756F
Separator	#DED9CF
Dark Canvas	#111210

Role	Hex
Dark Raised	#1A1C19

Mood colors

Mood colors are meaningful data. They should appear when the website is showing a calendar, year mosaic, mood strip, pattern, or actual app screenshot. Do not use them as arbitrary decoration.

Mood	Hex
Rough	#D4845C
Low	#D4B85C
Ok	#E8D060
Good	#A8C67A
Great	#5FAF6E

Recommended page rhythm

- Header + Hero: #F1E5CE.
- Main feature sections: #F6F3EC and near-white alternation.
- Raised cards: #EFEFE3 or white.
- Privacy section: #2C374F with warm off-white text.
- Memories+ section: #8BD0B1 with #2C374F copy.
- Footer: #F6F3EC or #F1E5CE.

This gives the page more atmosphere than the ISLES white background while remaining calm.

10. Typography

Do not use a remote font service for v1.

Use native/system stacks. This is faster, more private, and makes the site feel like an extension of the iOS application.

Sans stack

```
--font-sans: -apple-system, BlinkMacSystemFont, "SF Pro Text", "SF Pro Display", "Segoe UI", Helvetica, Arial, sans-serif;
```

Use for:

- navigation;
- buttons;
- metadata;
- body copy;
- feature labels;

- pricing;
- legal pages.

Serif stack

```
--font-serif: ui-serif, "New York", Georgia, "Times New Roman", serif;
```

Use selectively for:

- hero display line;
- dates;
- quoted memory text;
- large archival section headings;
- the **One more thing** visual if shown.

Do not make the whole website serif.

Type scale

Desktop recommendations:

- Hero H1: `clamp(54px, 6.2vw, 86px)`, line-height 0.96.
- Hero support line: `clamp(30px, 3.3vw, 50px)` if used.
- Major H2: `clamp(42px, 4.5vw, 68px)`.
- Section H3: 24-30px.
- Body large: 19-22px.
- Standard body: 16-18px.
- Small/meta: 13-15px.

Mobile:

- Hero H1 around 48-56px depending viewport.
- H2 around 36-44px.
- Body 17-19px.

Avoid thin font weights. Use 600-750 for interface headings.

11. Shape and shadow language

Rounded corners should echo the app and logo.

- Small UI controls: 12-14px.
- Buttons: 14-18px.
- Feature cards: 24-30px.
- Screenshot/phone frames: 36-52px.
- Large premium panels: 32-40px.

Shadows should be soft and warm:

```
--shadow-soft: 0 16px 44px rgba(44, 55, 79, 0.08);  
--shadow-nav: 0 8px 26px rgba(44, 55, 79, 0.08);
```

No glossy neon, glow, or glassmorphism-heavy styling.

PART IV - SITE ARCHITECTURE

12. Recommended folder structure

Create a new website folder at the current Memories repository root:

```
Memories/  
  Website/  
    index.html  
    privacy.html  
    terms.html  
    support.html  
    styles.css  
    main.js  
    vercel.json  
    robots.txt  
    sitemap.xml  
    site.webmanifest  
    assets/  
      logo.png  
      favicon.png  
      app-store-badge.svg  
      og-image.png  
      hero-today.png  
      calendar.png  
      patterns.png  
      year-mosaic.png  
      memory-detail.png  
      explore.png  
      map.png  
      media.png  
      memory-book.png  
      README.md  
      # later / placeholder instructions only  
      # user-supplied app screenshot  
      # user-supplied app screenshot  
      # user-supplied app screenshot  
      # user-supplied app screenshot  
      # user-supplied app screenshot  
      # user-supplied app screenshot  
      # Plus screenshot, optional  
      # Plus screenshot, optional  
      # Plus screenshot, optional
```

Also retain source brand assets under `Branding/Website/`.

The website should be independently deployable. Xcode must not treat `Website/` files as app bundle resources unless explicitly needed.

13. Technology choice

Use:

- static HTML;
- modern CSS;
- minimal vanilla JavaScript;
- Vercel static deployment.

Do **not** add React, Next.js, Vue, Svelte, a CMS, database, server function, account system, or analytics SDK for v1.

Do not require npm to render the landing page.

Do not rely on Tailwind CDN. The ISLES site uses it, but Memories is simple enough that a single clear `styles.css` is better. This also removes an external script dependency.

No cookie banner is needed if the site uses no analytics, ad pixels, cookies, or other tracking. Keep it that way for launch.

14. Public routes

Required:

- `https://memoriesjournal.com/`
- `https://memoriesjournal.com/privacy`
- `https://memoriesjournal.com/terms`
- `https://memoriesjournal.com/support`

Support clean URLs through `vercel.json` rewrites or Vercel clean-url behavior.

Optional compatibility aliases:

- `/privacy.html`
- `/terms.html`
- `/support.html`

Canonical URLs should use the extensionless routes.

Redirect `www.memoriesjournal.com` to `memoriesjournal.com` or vice versa. Prefer apex `memoriesjournal.com` as canonical.

PART V - HOMEPAGE, SCREEN BY SCREEN

15. Sticky header

Figure 4. Conceptual homepage structure. This is a layout map, not a pixel-perfect website mockup.

Desktop

Height: roughly 80-86px.

Background:

```
rgba(241, 229, 206, 0.86)
```

Use `backdrop-filter: blur(12px)` where supported.

Left:

- stacked-card logo at ~34px;
- text wordmark `Memories` next to it.

The wordmark should be real HTML text rather than a baked image. Use navy.

Right navigation:

- Features
- Memories+
- Privacy
- App Store badge / prelaunch CTA

Keep this slightly simpler than the ISLES nav.

Mobile

Height: ~70-74px.

Show:

- logo + `Memories`;
- compact App Store/Coming Soon control.

Hide section navigation rather than creating a hamburger menu for a four-link website.

App Store state

Before App Store URL exists:

- do not use a dead `#` badge as if the app were available;
- show a restrained `Coming to the App Store` pill or a disabled/local badge state;
- centralize the state in `main.js` or a small config object.

After the real listing exists, one URL change should update all App Store CTAs.

16. Hero

Purpose

Explain the app immediately and make it look like a product someone would keep on their phone for years.

Layout

Desktop:

- two-column layout;
- left copy ~45%;
- right product art ~55%;
- min-height around 700-780px depending viewport.

Mobile:

- centered copy first;

- product art beneath;
- hero should fit comfortably without forcing an enormous first scroll.

Recommended hero copy

Small optional eyebrow:

Memories for iPhone

Main headline, serif or mixed serif/sans:

Keep one thing from today.

Support line:

Remember a lot more of your life.

Body:

Memories is a private daily journal for the days you do not want to lose. Write a line, mark how the day felt, add a little context, and move on.

CTA:

- prelaunch: **Coming soon to the App Store**
- live: official **Download on the App Store** badge

Small line under CTA:

No account. No ads. Built for iPhone.

Hero visual

Do not use stock photography.

Use a three-layer composition inspired by the stacked-card logo:

5. Rear rounded slate panel.
6. Middle navy panel.
7. Front device/screenshot surface.

The hero should contain a real screenshot of Today, not a manually recreated fake app interface.

Preferred screenshot:

- Today compose or completed-memory screen with representative sample data;
- no personally identifying real journal content;
- use purpose-built demo entries.

A second small calendar/year card may sit behind or below the main device to hint at the payoff.

Do not angle the phone more than a few degrees. Memories should feel settled, not kinetic.

17. Section: A minute is enough

Background: near-white or app canvas.

Heading:

A minute is enough.

Intro:

Memories keeps the daily part small. The archive does the growing later.

Three feature cards, echoing the three-column value section from ISLES but redesigned around the stacked-card motif.

Card 1

Write one thing.

One line is enough. Longer is there when you want it.

Visual:

A tiny raised writing card with a date and one short demo sentence.

Card 2

Mark the day.

Rough, Low, Ok, Good, or Great. Just enough color to remember how the day landed.

Visual:

Five mood dots/blocks using the actual app palette.

Card 3

Add what mattered.

People, places, a photo, a voice note, or nothing else at all.

Visual:

A few quiet tag pills plus photo/location symbols.

No **habit**, **streak**, or **mindfulness** language.

18. Section: Interactive feature showcase

This should be the Memories counterpart to the ISLES **Search, scan, or paste** interactive feature section.

Heading:

Your days start small. Then they add up.

Desktop layout:

- app screenshot/phone on left;
- selectable feature cards on right.

Mobile:

- cards below screenshot;
- tap changes screenshot;
- no hover dependency.

Feature cards:

Today

One page in about a minute.

Write whatever you want, mark the day, and stop there if that is enough.

Asset: `hero-today.png` or `today.png`.

Calendar

See the month you actually had.

Each saved day becomes part of the archive, colored by how the day felt.

Asset: `calendar.png`.

Patterns

Little things you might've missed.

Patterns use the days you recorded to surface simple, specific observations without trying to diagnose you.

Asset: `patterns.png`.

Year

Watch 365 days become your own.

The free Year Mosaic turns the whole year into a quiet map of the days you kept.

Asset: `year-mosaic.png`.

Explore

Follow the parts of life that keep showing up.

Memories+ adds Collections, Threads, Chapters, places, media, and deeper ways to move through your archive.

Asset: `explore.png`.

Interaction

- Default active card: Today.

- Auto-cycle every 5.5-6 seconds on desktop only.
 - Hover or focus selects a card and pauses auto-cycle.
 - Tap selects on touch.
 - Fade/crossfade screenshot in ~160-220ms.
 - Do not auto-cycle if `prefers-reduced-motion`.
 - Keep active-card translation very small, at most 4-6px.
-

19. Section: Year Mosaic signature moment

This should be one of the most visually memorable sections of the site.

Background: logo cream `#F1E5CE`.

Heading:

See the year you actually had.

Body:

No streaks. No score. Just the days you kept.

Display a large year mosaic using the real mood palette.

Prefer a real screenshot from the app once the Year Mosaic is visually final. Until then, a website-only decorative mosaic may be used as background/support art, but it must not pretend to be a screenshot.

Optional metadata around the mosaic:

182 days remembered

48 Great · 61 Good · 39 Ok · 22 Low · 12 Rough

Use obviously fictitious demo data.

Motion

When the section first enters the viewport, day cells may fade in in small clusters over ~700-1000ms.

Do this only once.

No rapid cascading rainbow effect.

Reduced Motion: render the complete mosaic immediately.

20. Section: Remember the ordinary days

This section explains why the product matters without becoming sentimental advertising.

Heading:

The big days already get photographed.

Follow-up line:

Memories is for the Tuesday dinner, the dumb joke, the apartment, the weather, and the walk home too.

Visual layout:

- one historical memory detail screen;
- one photo/media card;
- one small **On this day** card.

Suggested supporting copy:

A year later, the useful part is not that you completed a journal prompt. It is that you can open a date and remember what was actually happening.

Do not use fake nostalgia filters or faux Polaroids. Use the actual app's archival visual language.

21. Section: Privacy

This should be a visually distinct dark-navy band.

Background: #2C374F.

Heading:

Your journal isn't a chatbot.

Body:

Memories is built to keep the writing yours. No account. No ads. No remote AI reading your journal. The app works offline, and private iCloud sync can keep your archive with your Apple account when enabled.

Important: Do not publish the iCloud-sync sentence until real-device CloudKit QA is green. Keep it behind a simple website copy flag or TODO until validated.

Three trust items:

No account

Open the app and write. There is no Memories profile to create.

No ads

Your journal is not inventory for an advertising system.

No AI reading entries

Patterns are calculated from your own recorded data. Memories does not send your journal to a remote AI service.

Optional fourth item after CloudKit QA:

Private Apple sync

When iCloud is enabled, your archive syncs through your private iCloud account.

Do not claim end-to-end encryption unless the exact CloudKit/storage configuration has been verified to support that statement.

PART VI - MEMORIES+ WEBSITE SECTION

22. Premium philosophy

The site should make one principle clear:

The journal stays useful for free. Memories+ unlocks richer ways to explore the archive you have built.

Do not frame Memories+ as paying to keep your data safe.

The following stay free and should never be described as premium-only:

- basic daily memory;
- mood;
- tags;
- randomized daily prompt;
- one photo;
- basic voice memory;
- location;
- Calendar;
- Timeline;
- basic Search;
- basic Patterns;
- Year Mosaic;
- Face ID/app lock;
- basic text/JSON export;
- CloudKit/iCloud sync when shipping;
- basic data ownership/safety.

23. Memories+ section design

Background: Brand Mint #8BD0B1.

Instead of ISLES' wave/blob section, use one or two broad **stacked rounded layers** at the top/bottom edge, as though the green section is another large day card in the stack.

Heading:

Small eyebrow:

Memories+

Main:

See more in your memories.

Body:

The journal stays useful for free. Memories+ unlocks richer ways to explore, understand, and preserve the archive you have built.

Do not lead with price on the website until live App Store products exist and pricing is final in the storefront.

24. Memories+ pillars

Use six compact cards or two rows of three. These are product pillars, not separate subscription tiers.

Explore

Collections, Threads, Media, Map, and deeper archive filters.

Short copy:

Follow the people, places, tags, and stretches of life that keep showing up.

Understand

Deeper Patterns, Then / Now, month and year comparisons.

Short copy:

Notice specific changes in your own archive without turning them into a score.

Preserve

Memory Book PDF exports and richer year recaps.

Short copy:

Turn a month, year, or chapter into something you can keep outside the app.

Capture more

Multiple photos per day.

Do not advertise voice transcription or video until actually complete.

Short copy:

Keep more of the days that need more than one picture.

Personalize

Your own prompts in the `One more thing` library.

Short copy:

Add questions you actually want to be asked again.

Look back

Richer recaps and deeper historical views.

Short copy:

Give the archive more ways to bring an old day back.

25. Memories+ feature truth table for website

Cursor should implement website copy from a centralized data structure or clearly isolated HTML block so these statuses are easy to change.

Feature	Website at current Phase 2 state
Media timeline	May market after smoke test
Memory Map	May market after physical location/Map smoke test
Multiple photos	May market after StoreKit/Plus smoke test
Custom prompt library	May market after smoke test
Year Recap	May market after smoke test
Collections	May market, but avoid claiming elaborate filter UX until polished
Threads	May market after smoke test
Chapters	May market after smoke test
Then / Now	May market after data-threshold smoke test
Memory Book PDF	May market after export QA
Widgets	Do not market yet
Share Extension	Do not market yet
Voice transcription	Do not market yet
Video	Do not market yet
Journaling Suggestions	Do not market yet
Apple Watch	Never market; rejected
Journal imports	Never market; rejected

If a feature is not green in QA, remove it from marketing rather than marking it `coming soon` inside the premium section.

PART VII - FINAL CTA AND FOOTER

26. Final CTA

Return to cream/app-canvas background.

Heading:

Keep today.

Body:

One line is enough to start an archive.

Prelaunch CTA:

Coming soon to the App Store

Live CTA:

Official App Store badge.

Optional small line:

Made for iPhone.

Do not use an email waitlist unless the user explicitly chooses to operate one. A waitlist creates additional data/privacy work that the site does not currently need.

27. Footer

Follow the clean ISLES footer structure, adapted to Memories.

Column 1:

- logo icon + text **Memories**;
- **Operated by Meadow Labs LLC.**

Column 2 - Legal:

- Privacy Policy
- Terms of Use

Column 3 - Company:

- Support
- optionally Meadow Labs link if desired

Column 4 - Download:

- App Store badge or **Coming soon** state

Bottom line:

© 2026 Meadow Labs LLC. Memories.

Use JavaScript to keep the year current.

Do not display a support email unless that inbox actually exists.

PART VIII - EXACT HOMEPAGE COPY BANK

28. Recommended launch copy

Cursor may use this wording as the initial site copy. The page should remain easy to edit later.

Header

- Features
- Memories+
- Privacy
- Coming soon / App Store badge

Hero

Memories for iPhone

Keep one thing from today.

Remember a lot more of your life.

Memories is a private daily journal for the days you do not want to lose. Write a line, mark how the day felt, add a little context, and move on.

No account. No ads. Built for iPhone.

Daily loop

A minute is enough.

Memories keeps the daily part small. The archive does the growing later.

Write one thing.

One line is enough. Longer is there when you want it.

Mark the day.

Rough, Low, Ok, Good, or Great. Just enough color to remember how the day landed.

Add what mattered.

People, places, a photo, a voice note, or nothing else at all.

Feature showcase

Your days start small. Then they add up.

Today

One page in about a minute.

Calendar

See the month you actually had.

Patterns

Little things you might've missed.

Year

Watch 365 days become your own.

Explore

Follow the parts of life that keep showing up.

Year

See the year you actually had.

No streaks. No score. Just the days you kept.

Remembering

The big days already get photographed.

Memories is for the Tuesday dinner, the dumb joke, the apartment, the weather, and the walk home too.

A year later, the useful part is not that you completed a journal prompt. It is that you can open a date and remember what was actually happening.

Privacy

Your journal isn't a chatbot.

Memories is built to keep the writing yours. No account. No ads. No remote AI reading your journal.

No account

Open the app and write. There is no Memories profile to create.

No ads

Your journal is not inventory for an advertising system.

No AI reading entries

Patterns are calculated from your own recorded data. Memories does not send your journal to a remote AI service.

Add private-iCloud copy only after device QA is green.

Premium

Memories+

See more in your memories.

The journal stays useful for free. Memories+ unlocks richer ways to explore, understand, and preserve the archive you have built.

Explore

Follow the people, places, tags, and stretches of life that keep showing up.

Understand

Notice specific changes in your own archive without turning them into a score.

Preserve

Turn a month, year, or chapter into something you can keep outside the app.

Capture more

Keep more of the days that need more than one picture.

Personalize

Add questions you actually want to be asked again.

Look back

Give the archive more ways to bring an old day back.

Final CTA

Keep today.

One line is enough to start an archive.

PART IX - APP SCREENSHOT AND ASSET SPEC

29. Asset-drop philosophy

Cursor should create the website so missing screenshots do not break layout, but it must not fabricate app screenshots.

Create graceful placeholder surfaces labeled in development only, for example:

`DROP calendar.png HERE`

Do not ship those placeholders in production.

All app UI shown in production marketing should come from real screenshots of the actual build.

30. Screenshot list

The website should be ready to accept at least these images:

`hero-today.png`

Recommended content:

- Today compose or saved-day screen;
- one tasteful fake/demo journal entry;
- mood and a few tags visible;
- no personal user data.

`calendar.png`

- colorful month;
- enough entries to show mood variation;
- no debug UI.

`patterns.png`

- one or two strong deterministic Pattern cards;
- avoid empty state.

`year-mosaic.png`

- Year Mosaic with rich but believable demo archive.

`memory-detail.png`

- saved historical memory with photo/date/tags.

`explore.png`

- Collections/Threads/Chapters entry point or a particularly good detail screen.

Plus optional

- `map.png`
- `media.png`
- `memory-book.png`

Use Plus-only screenshots only in clearly Memories+ contexts.

31. Screenshot dimensions for the website

Do not force a particular iPhone screenshot pixel dimension in the website source. Accept the native-resolution PNG exported by Simulator/device and normalize through responsive CSS.

For optimized web copies:

- retain the full-resolution master PNG outside or inside `Branding/Website/Masters/` if desired;
- create WebP/AVIF versions for production where quality remains clean;
- target approximately 700-1000 CSS-pixel equivalent width for the largest displayed screenshot;
- use `srcset` if multiple raster sizes are generated.

Do not resize screenshots so aggressively that SF text becomes blurry.

Do not add an iPhone bezel directly into the screenshot bitmap unless intentionally creating a hero composite. Prefer a CSS/device-shell frame so screenshots can be swapped easily.

32. App Store badge

Use Apple's official App Store badge asset.

Keep it local in `/Website/assets/` once downloaded/approved.

Do not redraw the badge.

Before the App Store listing exists, use the neutral `Coming soon to the App Store` component instead of a fake clickable badge.

33. Open Graph image

Prepare a 1200x630 `og-image.png` later.

Recommended composition:

- logo cream background;
- stacked-card logo mark left;
- `Memories` wordmark;
- headline: `Keep one thing from today.`;
- small crop of Year Mosaic or one Today screen on the right.

No App Store rating, review count, or launch claim unless real.

PART X - MOTION AND INTERACTION

34. Motion principles

The site should inherit the app's quiet motion behavior.

Use motion to explain hierarchy or make the archive feel alive.

Do not use:

- parallax that moves every section;
 - scroll hijacking;
 - video backgrounds;
 - particle effects;
 - confetti;
 - bouncing buttons;
 - cursor trails;
 - giant easing overshoots;
 - autoplay testimonial carousels.
-

35. Recommended motion

Hero

The front screenshot stack may drift vertically by 3-4px over a 7-9 second loop.

Reduced Motion: none.

Feature showcase

Crossfade between real screenshots in 160-220ms.

Active card may move left 4px on desktop.

Year Mosaic

One-time subtle cluster fade-in on intersection.

Premium cards

No constant animation. On hover, 1-2px lift and small shadow increase.

Header

Sticky with blur; no collapsing/expanding behavior needed.

PART XI - RESPONSIVE DESIGN

36. Breakpoints

Recommended CSS breakpoints:

- `< 640px`: phone.
- `640-899px`: large phone/small tablet-sized browser, still mobile layout.
- `900-1099px`: compact desktop/tablet browser.
- `>= 1100px`: full desktop composition.

The app itself is iPhone-only. The **website** must still be responsive on iPad, desktop, and all normal browsers.

37. Mobile behavior

Header

- hide text nav links;
- keep logo/wordmark;
- compact CTA.

Hero

- center copy;
- stack visual below;
- no horizontal overflow;
- no oversized device that forces a 2-screen hero.

Three-card section

- one column;
- cards can be horizontal compact rows if visually stronger.

Feature showcase

- screenshot first;
- horizontal-scroll or stacked feature selector beneath;
- tap interaction only.

Premium

- one-column cards;
- retain generous 20-24px side padding.

Footer

- one or two columns;
 - no tiny four-column squeeze.
-

PART XII - ACCESSIBILITY

38. Accessibility requirements

Use semantic HTML throughout.

Required:

- `<header>`, `<nav>`, `<main>`, `<section>`, `<footer>`;
- correct heading hierarchy;
- skip-to-content link;
- visible keyboard focus states;
- keyboard-operable feature cards;
- ARIA only where native semantics are insufficient;
- meaningful alt text on app screenshots;
- empty alt on decorative blobs/layers;
- no text embedded only inside images where it matters to understanding;
- minimum 44px touch targets for key mobile controls;
- `prefers-reduced-motion` support;
- sufficient contrast.

Mood color in website diagrams must be paired with labels where interpretation matters.

Do not rely on color alone to communicate Rough/Low/Ok/Good/Great in any explanatory chart.

PART XIII - PERFORMANCE AND PRIVACY

39. Performance targets

The site should feel immediate.

Targets:

- minimal JS;
- no framework hydration;
- no web font requests;
- no analytics SDK;
- no cookie banner;
- no giant uncompressed hero PNGs;
- lazy-load below-fold screenshots;
- hero image may be eager-loaded/preloaded if it is the LCP element;
- preserve intrinsic dimensions to prevent layout shift.

Compress decorative images and screenshots carefully.

Do not sacrifice screenshot readability for tiny file sizes.

40. Site privacy

Launch without analytics unless there is a concrete later need.

Do not add:

- Google Analytics;
- Meta Pixel;
- Hotjar;
- session replay;
- ad tags;
- fingerprinting;
- email capture;
- third-party form embeds.

This keeps the website privacy story consistent with the app and removes cookie-consent complexity.

If analytics are added later, update the Privacy Policy before deployment.

PART XIV - SEO AND METADATA

41. Homepage metadata

Recommended title:

Memories - Daily journaling with no fluff

Recommended meta description:

A private iPhone journal for keeping one small thing from each day. Write a line, mark the day, and look back through calendars, patterns, photos, places, and more.

Canonical:

<https://memoriesjournal.com/>

Open Graph/Twitter metadata should use the future `og-image.png`.

Use the supplied favicon.

Add Apple touch icon using the best available icon asset.

42. Structured data

Optional but recommended once the App Store listing is real:

JSON-LD `SoftwareApplication` with:

- name: Memories;
- operatingSystem: iOS;
- applicationCategory: LifestyleApplication;
- url: memoriesjournal.com;
- downloadUrl: real App Store URL;
- offers: only when price data is accurate and stable.

Do not add fake AggregateRating or review counts.

Before launch, omit `downloadUrl` if no listing exists.

43. robots and sitemap

`robots.txt`:

- allow normal crawling;
- point to sitemap.

`sitemap.xml` should include:

- `/`
- `/privacy`
- `/terms`
- `/support`

Do not index development/preview Vercel URLs if it can be avoided.

PART XV - PRIVACY POLICY, TERMS, AND SUPPORT PAGES

44. Legal-page design

Reuse the homepage header/footer and the app's neutral palette.

Content width: approximately 760-860px.

Readable line length and generous spacing.

Use sans body text for legal content.

H1: 44-54px desktop.

H2: 24-30px.

No decorative app screenshots on legal pages.

45. Privacy Policy page

Cursor should create the **page shell and styles**, but should not invent a final legal policy and mark it production-ready without user-supplied/finalized text.

Add a visible development TODO comment in source until final legal copy is inserted.

The eventual policy needs to accurately cover, at minimum:

- Memories is operated by Meadow Labs LLC.
- No Memories user account is required.
- Journal text is stored on the user's device.
- Private iCloud/CloudKit synchronization, if enabled in the shipping build.
- Photos selected/captured by the user.
- Voice recordings.
- Location data when the user explicitly adds a place.
- Notifications/reminders.
- StoreKit/App Store purchase processing by Apple.
- No remote AI processing of journal entries.
- No advertising.
- No third-party journal-content analytics.
- Export behavior.
- Data deletion behavior.
- What happens when the app is deleted and what may remain in iCloud, based on actual shipping behavior.
- Children's/privacy-age considerations as required.
- Policy changes.
- Contact route.

Do not say `we collect no data` if CloudKit, support email, website analytics, or other production behavior makes that technically inaccurate under the policy's chosen wording.

The App Store privacy questionnaire and website policy must agree.

46. Terms of Use page

Cursor should create the shell and placeholder heading structure, not fabricate final legal advice.

Likely sections for final Terms:

8. Acceptance.
9. Eligibility.
10. License to use Memories.
11. User journal content and ownership.
12. Device/iCloud storage and availability.
13. Memories+ purchases.
14. Auto-renewable subscription terms.
15. Lifetime purchase.
16. Apple billing/refunds.
17. Acceptable use.
18. Intellectual property.
19. Feedback.
20. App changes/discontinuation.
21. Disclaimer of warranties.
22. Limitation of liability.
23. Indemnification if appropriate.
24. Governing law.
25. Changes to Terms.
26. Contact.

Final wording should be reviewed separately before public App Store submission.

47. Support page

The support page can be fully designed now.

Title:

Support

Intro:

Need help with Memories, have feedback, or found something that is not working? Get in touch and include the iPhone model and iOS version if the problem is technical.

Do not hard-code a support email until the inbox is created.

Use a single configuration constant/comment, for example:

```
const SUPPORT_EMAIL = "REPLACE_BEFORE_LAUNCH";
```

Or place the email in HTML once real.

Recommended FAQ blocks:

Where are my memories stored?

Answer based on final CloudKit state.

Do I need an account?

No.

Can Memories read my journal with AI?

No remote AI service is part of the app.

How do I restore Memories+?

Use Restore Purchases inside Memories settings.

How do I export my memories?

Settings -> Data/Export, using the real current UI terminology.

How do I delete my data?

Explain the real app behavior only after final CloudKit deletion behavior is verified.

Support page should be suitable as the App Store Connect Support URL.

PART XVI - DEPLOYMENT

48. Vercel

The site should be deployable the same general way as ISLES.

Recommended:

- new Vercel project rooted at `Website/`;
- Framework Preset: Other / static;
- no build command if pure static;
- output directory: root/current folder as appropriate;
- connect `memoriesjournal.com`;
- redirect `www` to apex;
- enforce HTTPS automatically through Vercel.

Create `vercel.json` for clean URLs and headers if useful.

49. Security headers

Because the site is static and has no external JS/fonts, a fairly strict policy is practical.

Recommended headers where compatible:

- `X-Content-Type-Options: nosniff`
- `Referrer-Policy: strict-origin-when-cross-origin`
- `Permissions-Policy` disabling unused sensors/APIs
- `Content-Security-Policy` allowing self-hosted assets and the minimum needed sources

Do not break the App Store badge SVG or site visuals with an over-aggressive CSP. Test after deployment.

PART XVII - PRELAUNCH VS LIVE STATE

50. Prelaunch state

Before the App Store listing is public:

- **Coming soon to the App Store** in header/hero/final CTA.
- No fake download link.
- No fake ratings/reviews.
- No unverified CloudKit claims.
- Site may be deployed publicly to satisfy later policy/support URL needs.

The homepage can be live before App Store Connect public launch.

51. Live state

Once the App Store URL exists:

- replace all Coming Soon controls through one config change;
 - add official App Store badge;
 - add App Store link to structured data;
 - verify all Memories+ prices/features against the approved storefront;
 - verify privacy copy against the actual shipped build;
 - verify support email.
-

PART XVIII - RESPONSIVE COMPONENT SPEC

52. Header component

Suggested CSS classes:

- `.topbar`
- `.site-wrap`
- `.brand`
- `.brand-mark`
- `.brand-word`
- `.topnav`
- `.store-cta`

The wordmark should stay readable at 320px viewport width.

53. Screenshot shell

Create reusable:

- `.device-shell`
- `.device-screen`
- `.stack-layer`

The shell should not imitate exact iPhone hardware to a forensic degree. A clean rounded dark frame is enough.

Screenshot should fill without distortion.

Use `overflow: hidden` and consistent aspect ratio.

54. Feature cards

Reusable button/card:

- focusable;
- `aria-pressed` or equivalent state;
- active state uses mint-tinted surface and navy title;
- soft border;
- minimal transform.

Do not make the whole section inaccessible to keyboard users.

55. Mood mosaic component

Website-only decorative mosaic may use CSS grid.

Real data example must be labeled as sample/demo if it looks like statistics.

Cells:

- small rounded rectangles/squares;
- 4-6px radius;

- neutral empty state;
- mood colors exactly as app.

Do not calculate a fake mood score.

PART XIX - WEBSITE COPY RULES FOR PREMIUM AND PRIVACY

56. Do not overpromise

The website must not state:

- End-to-end encrypted unless verified.
 - Never leaves your device if CloudKit is enabled.
 - Data Not Collected as prose without confirming all production behavior.
 - Works on all your Apple devices because the app is iPhone-only.
 - iPad, Mac, Apple Watch, or Vision Pro support.
 - AI-free forever unless product policy truly commits permanently; No AI reading your journal is the more precise current statement.
 - Unlimited photos if Plus has a six-photo/day limit.
 - Video until built.
 - Voice transcription until built.
 - Widgets until built.
-

57. Product labels

Use Memories+, not Premium, Pro, Gold, or Ultra, in user-facing website copy.

Use Patterns with a capital P when referring to the app feature.

Use Year Mosaic when referring to the specific screen.

Use One more thing exactly for the daily optional prompt feature.

PART XX - CURSOR BUILD PHASES

58. Website Phase W0 - audit

Before writing website code:

27. Read `APP_BRIEF.md`.
28. Read `STATUS.md`.
29. Read this PDF/Markdown spec.
30. Inspect current `Branding/Website/` assets.
31. Inspect the supplied ISLES website source if it is present in the workspace/reference folder.
32. Confirm current git branch/status.
33. Do not modify Xcode project files.

Output a short audit before making structural changes if there are conflicts between current app behavior and this spec.

59. Website Phase W1 - scaffold

Create `Website/` with:

- `index.html`
- `styles.css`
- `main.js`
- `privacy.html`
- `terms.html`
- `support.html`
- `vercel.json`
- `robots.txt`
- `sitemap.xml`
- `site.webmanifest`
- `assets/`
- `README.md`

Copy the supplied logo/favicon into Website assets without deleting source files.

Implement global tokens, header, footer, metadata, responsive base.

No feature marketing yet beyond structural placeholder content.

60. Website Phase W2 - homepage

Implement in this exact order:

34. sticky header;
35. hero;
36. `A minute is enough` section;
37. interactive feature showcase;
38. Year Mosaic signature section;
39. ordinary-days/memory resurfacing section;
40. privacy section;

41. Memories+ section;
42. final CTA;
43. footer.

Use exact or closely aligned copy from this document.

Do not fabricate screenshots.

61. Website Phase W3 - real screenshot plumbing

Add asset mapping in `main.js` or simple data structure.

If a screenshot is missing:

- development-only placeholder;
- no broken image icon;
- clear filename required.

When the image appears in `assets/`, the UI should automatically use it with no structural rewrite.

62. Website Phase W4 - Memories+ and truth gating

Build the six-pillar premium area.

Keep all feature statements consistent with current app status.

Use a small `SITE_STATE` object or similarly obvious constants for:

- `isAppStoreLive`
- `appStoreURL`
- `isCloudSyncVerified`
- `supportEmail`

Do not create an application backend just for these values.

Example:

```
const SITE_STATE = {
  isAppStoreLive: false,
  appStoreURL: "",
  isCloudSyncVerified: false,
  supportEmail: ""
};
```

This is not sensitive configuration.

63. Website Phase W5 - legal/support shells

Build visually complete Privacy, Terms, and Support pages.

For Privacy/Terms:

- create heading structure;
- insert explicit `LEGAL COPY REQUIRED BEFORE PUBLIC APP STORE SUBMISSION` development comment/banner in source;

- do not display an ugly development warning to normal visitors once real text is added.
- Support can contain real FAQ answers only where current app behavior is known.
-

64. Website Phase W6 - motion/accessibility

Implement:

- feature selection;
- crossfade;
- reduced motion;
- keyboard behavior;
- focus states;
- year mosaic one-time reveal;
- sticky nav.

Test without a mouse.

65. Website Phase W7 - SEO/performance/deploy

Implement:

- metadata;
- canonical;
- OG placeholders;
- favicon/touch icon;
- robots;
- sitemap;
- Vercel config;
- security headers where safe;
- image lazy loading;
- responsive image dimensions.

Do not add analytics.

66. Website Phase W8 - QA

Verify at minimum:

Desktop

- 1440px wide.
- 1280px wide.
- Safari/Chromium where available.

Mobile

- 390px wide.
- 375px wide.
- 320px minimum sanity check.

Functional

- header anchors.
- feature selector.
- keyboard operation.
- reduced-motion mode.
- no horizontal overflow.
- footer links.
- clean URL behavior.
- favicon.
- all images have correct alt behavior.
- no 404s for referenced local assets.

Lighthouse-oriented

- no obvious layout shifts.
 - hero not excessively heavy.
 - no console errors.
 - no third-party tracking requests.
-

PART XXI - ACCEPTANCE CHECKLIST

67. Visual acceptance

- Website clearly resembles the design taste of getisles.com without looking like a reskin.
 - Memories palette and stacked-day motif are unmistakable.
 - Hero communicates the app within ten seconds.
 - Real app screenshots dominate product sections.
 - Mood colors appear primarily as user-life data.
 - Premium section is distinct but not loud.
 - No decorative clutter.
 - Mobile layout is deliberate.
-

68. Product acceptance

- iPhone-only language throughout.
 - No iPad/Watch/Mac claims.
 - No streak language.
 - No AI feature claims.
 - No import claims.
 - No remote journal backend claims.
 - Free vs Memories+ copy is accurate.
 - Year Mosaic is described as free.
 - CloudKit copy is gated until device QA.
 - Deferred features are absent.
-

69. Trust acceptance

- No analytics.
 - No cookies/tracking.
 - No account/waitlist forms.
 - Privacy/Terms routes exist.
 - Support route exists.
 - No fake support email.
 - No fake App Store URL.
 - Legal copy is visibly tracked as unfinished in source until finalized.
-

70. Technical acceptance

- Static site runs locally by opening/serving `Website/`.
- No npm install required.
- No framework runtime.
- No Xcode changes required.
- Vercel deployment works from `Website/`.
- Clean URLs work.
- Sitemap/robots use memoriesjournal.com.

- All critical content remains usable with JavaScript disabled except optional screenshot cycling.
-

PART XXII - FINAL CURSOR MASTER INSTRUCTION

71. Copy/paste instruction for Cursor

Use the following as the top-level implementation instruction after this specification is added to the repo:

Build the Memories marketing website described in `WEBSITE_BUILD_SPEC.pdf` / `WEBSITE_BUILD_SPEC.md` as a new static `Website/` directory at the repository root. Before editing, read `APP_BRIEF.md`, `STATUS.md`, and this website spec completely, then inspect the supplied Memories logo/favicon and the ISLES website reference source. The ISLES site is a structural inspiration only; do not reskin or copy its branding.

Preserve the Memories product rules: iPhone only; three app tabs; no streaks, scores, accounts, ads, social graph, remote AI journaling, remote journal backend, Apple Watch, or competitor imports. Do not modify the Xcode project as part of the website build.

Use static HTML, CSS, and minimal vanilla JavaScript. Do not add React/Next/Vue/Svelte, a CMS, database, npm dependency, analytics, cookies, remote fonts, or tracking. Use native/system font stacks. Create homepage, privacy, terms, and support routes, plus Vercel configuration, sitemap, robots, manifest, favicon, and responsive assets structure.

Use the supplied stacked-card logo, exact Memories/app colors, quiet archival layout, real app screenshots when supplied, a sticky cream header, large two-column hero, three-part daily-loop section, interactive product screenshot selector, Year Mosaic signature section, dark privacy section, mint Memories+ section organized around Explore / Understand / Preserve / Capture more / Personalize / Look back, final CTA, and footer.

Do not fabricate app screenshots. Build graceful development placeholders keyed to the exact filenames in the spec. Do not publish claims about CloudKit until `isCloudSyncVerified` is true. Do not create fake App Store links before the listing exists. Centralize App Store URL, CloudKit verification, and support email in a tiny static `SITE_STATE` object.

Build Privacy and Terms page shells, but do not invent final legal content and mark it ready for production. Add clear source TODOs for final policy text. The support page may use confirmed product behavior and should not display an email until a real inbox is configured.

Implement all accessibility, reduced-motion, responsive, performance, and SEO requirements in the spec. Then run a complete desktop/mobile/local-link QA pass and return a report with files changed,

screenshots/assets still needed, production TODOs, Vercel setup steps, and anything that remains blocked on App Store/CloudKit/support/legal information.

PART XXIII - REQUIRED CURSOR FINAL REPORT

72. Cursor should return

After the website pass, Cursor's response should include:

A. Files created/changed

Exact list.

B. Homepage sections

Confirm each requested section exists.

C. Asset status

For every expected image:

- present;
- placeholder;
- missing/user action required.

D. Product-truth status

Confirm no deferred/rejected features are being marketed.

E. Legal/support status

Identify placeholders and exactly what user content is still required.

F. Prelaunch/live switch

Explain where App Store URL, support email, and CloudKit-verification state are changed.

G. Responsive QA

List viewport sizes tested.

H. Accessibility QA

Keyboard, focus, reduced motion, alt text, heading hierarchy.

I. Performance

List large assets and any optimization still recommended.

J. Deployment

Exact Vercel root/config and domain steps for `memoriesjournal.com`.

K. Next actions for Zen

Keep this short and concrete.

PART XXIV - ASSETS STILL NEEDED FROM THE USER

73. Before the website can be fully production-ready

The build can begin immediately with the supplied logo/favicon. The following should be provided after the relevant app screens are final and smoke-tested:

44. hero-today.png
45. calendar.png
46. patterns.png
47. year-mosaic.png
48. memory-detail.png
49. explore.png
50. optional Plus screenshots: Map, Media, Memory Book
51. official App Store badge asset
52. real App Store URL when available
53. real support email on memoriesjournal.com
54. finalized Privacy Policy text
55. finalized Terms of Use text
56. optional 1200x630 Open Graph artwork

Use demo journal content created specifically for marketing. Do not use genuine personal entries in website screenshots.

74. Final design test

Before calling the website complete, ask:

- Does the first screen explain Memories without needing a paragraph?
- Does the page show why someone would still care after six months?
- Does it look like the same product as the iOS app?
- Is the year/archive more visually important than mood tracking alone?
- Does the site avoid looking like a wellness app?
- Does it avoid looking like a productivity app?
- Does the Memories+ section sell exploration rather than withholding basic journaling?
- Are privacy claims precise enough to survive App Review scrutiny?
- Is every marketed feature actually present in the app?
- Would a person understand that this is iPhone-only?
- Is there anything on the page that feels noisier than the app itself?

If the answer to the last question is yes, remove something.

75. Product summary for the website builder

Memories is a small daily action with a long memory.

A user writes one thing, marks roughly how the day felt, optionally adds context, and leaves. The website should make that daily interaction feel almost effortless. Then it should spend the rest of its time showing what happens after those little records accumulate: a colored month, an entire year, old photos with context, places, Patterns, Chapters, Collections, Threads, recaps, and a Memory Book.

The visual system should behave the same way. The interface itself is quiet. The user's days supply the color.

That is the website.

Keep today.

One line is enough to start an archive.

memoriesjournal.com
